

Investigating a Malicious Email using Maltego.

Project Implementation details:

Here I have set up and used Maltego software after installing various transforms and entities to investigate a phishing email in the Kali Linux environment, which results with a graph and the details are generated in the pdf format.

Maltego is a data visualisation and analysis tool used for information gathering and link analysis. It is developed by Paterva, and it is designed to assist in the process of open-source intelligence (OSINT) gathering and reconnaissance. The software allows users to explore and connect various pieces of information from different sources to create a visual representation of relationships and associations.

Maltego provides a graphical interface for users to create and manipulate entities and links between them. This helps in visually understanding the relationships and connections between different pieces of information.
